1 Introduction

The purpose of this project is to design and simulate a functional, real-world network environment that incorporates fundamental networking services and demonstrates how they interact within a multi-subnet topology. This project focuses on building a network with two subnets connected through a router, enabling communication between various hosts and services.

The network simulation includes three essential services: a DHCP server responsible for dynamically assigning IP addresses to end devices, a DNS server that resolves domain names to IP addresses, and a web server that provides accessible web content to clients. As part of the exploration, clients in the network are expected to communicate with each other, request domain name resolutions, and access web pages.

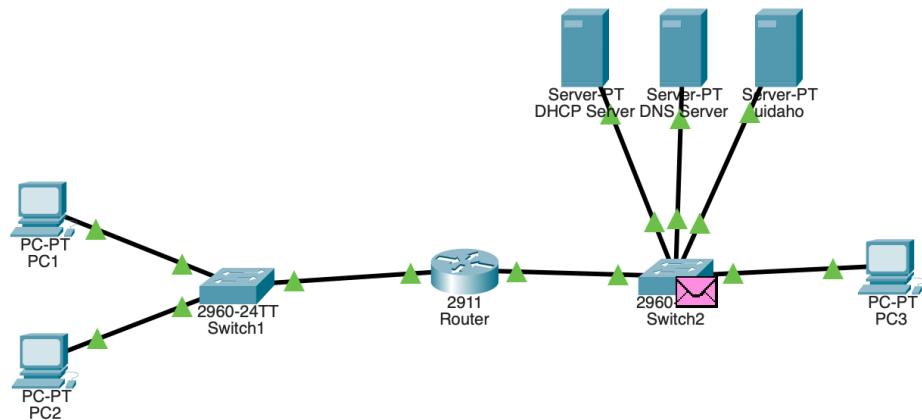

Additionally, this project emphasizes understanding packet flow by inspecting Protocol Data Units (PDUs) for both outbound and inbound traffic. Through analyzing PDUs, we gain insight into how data is encapsulated, transmitted, and processed across the network layers.

2 Network Topology

2.1 Logical Topology

The network is composed of two subnets connected through a central router. The first subnet (192.168.1.0/24) includes a switch and two end-user PCs. The second subnet (192.168.2.0/24) contains a switch, three servers, and one PC. Together, these subnets form a functional topology that supports inter-device communication and service interactions across the router.

2.2 Virtual Setup

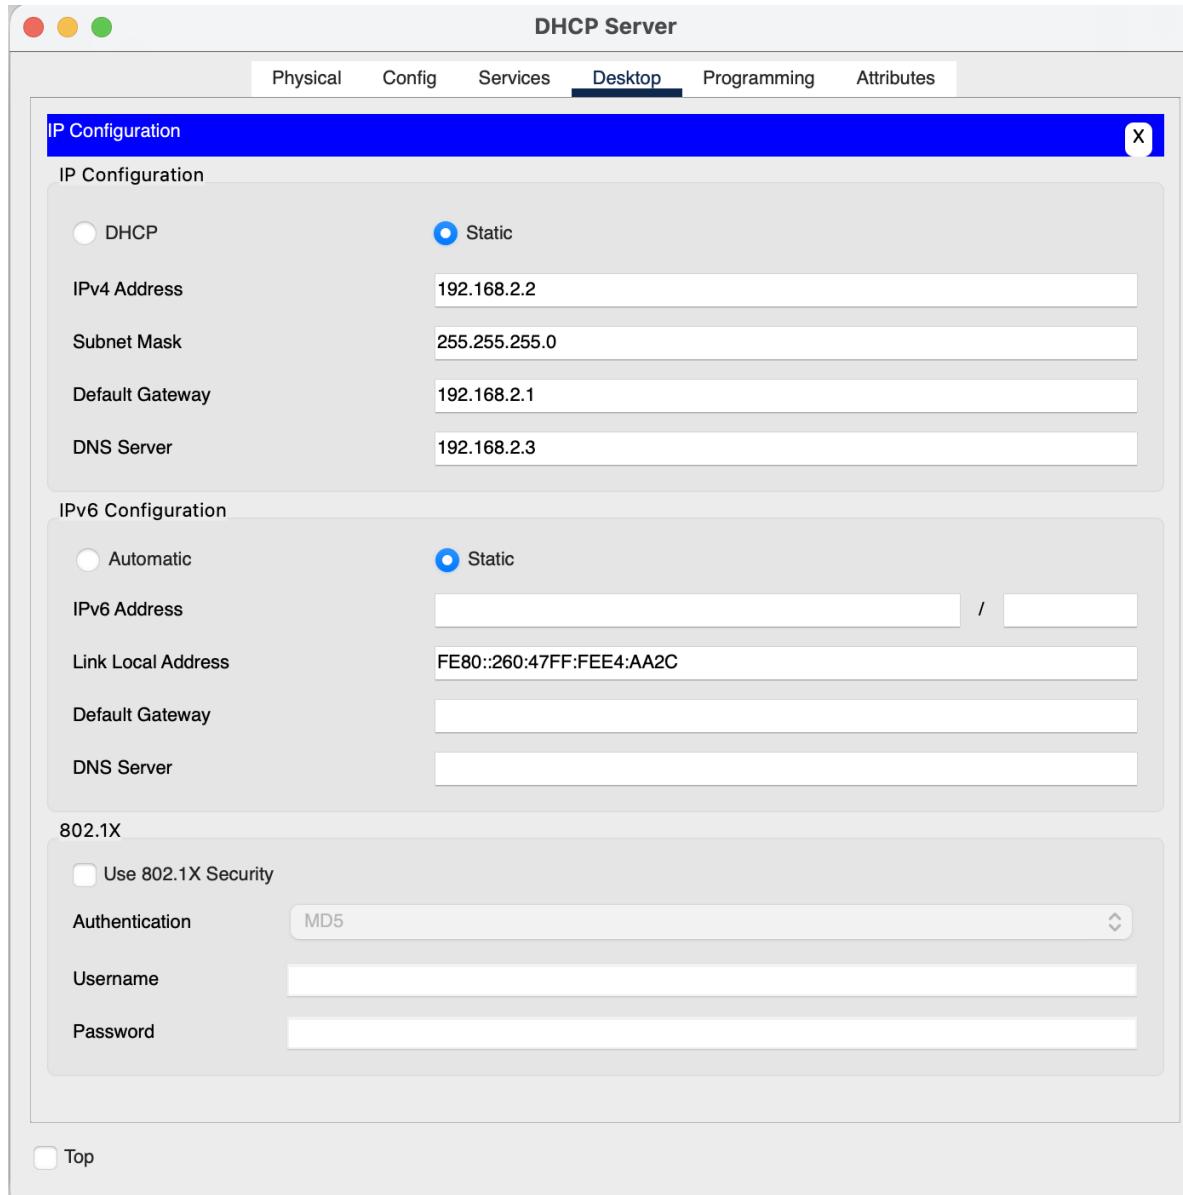

2.3 Servers Configuration

Table 1: Host IP Addressing Overview

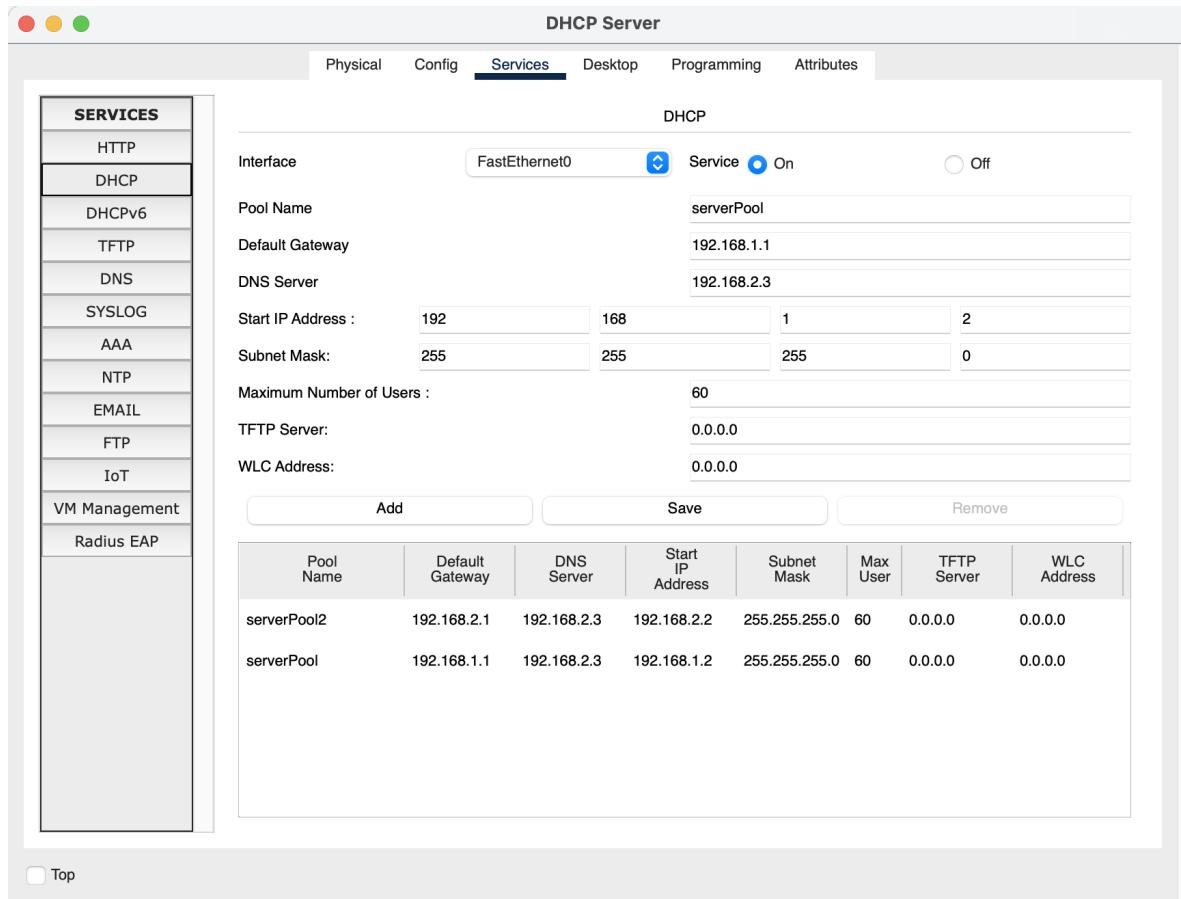

Host	Role	IP Address
DHCP Server	DHCP Address Resolution	192.168.2.2
DNS Server	DNS Queries Resolution	192.168.2.3
uidaho	WebServer	192.168.2.4

3 DHCP Configuration

3.1 DHCP IP Address Configuration

3.2 DHCP Server Address Pools Configuration

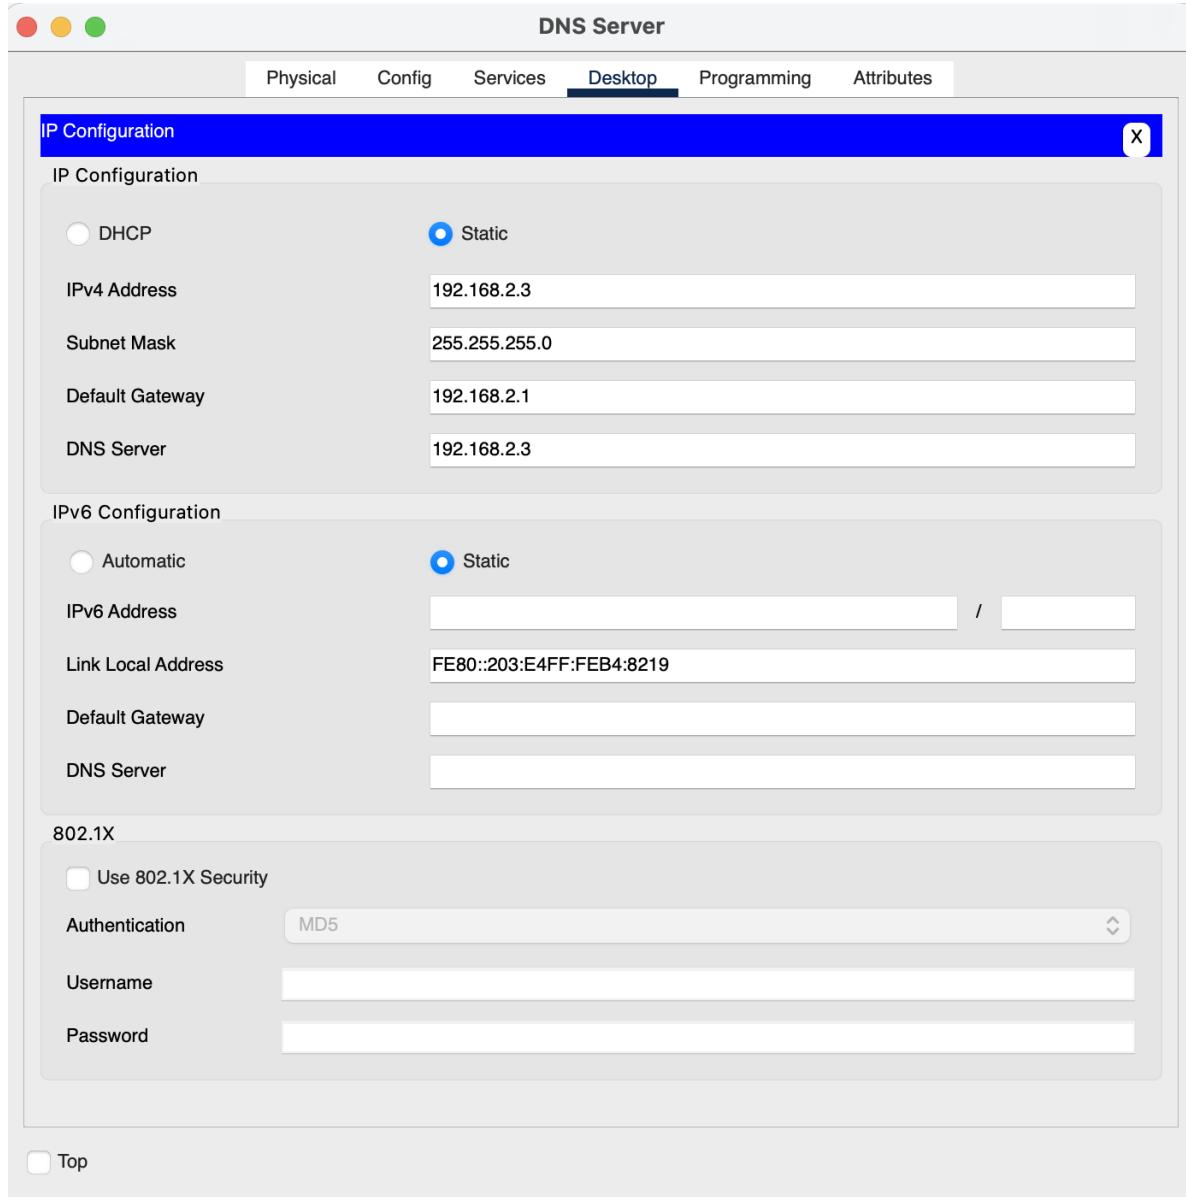

3.3 DHCP Router Configuration

```
Router(config)#ip dhcp excluded-address 192.168.1.1
Router(config)#ip dhcp excluded-address 192.168.2.1
Router(config)#ip dhcp pool 192.168.1.1
Router(dhcp-config)#network 192.168.1.0 255.255.255.0
Router(dhcp-config)#default-router 192.168.1.1
Router(dhcp-config)#dns-server 192.168.2.3
Router(dhcp-config)#exit
Router(config)#ip dhcp pool 192.168.2.1
Router(dhcp-config)#network 192.168.2.0 255.255.255.0
Router(dhcp-config)#default-router 192.168.2.1
Router(dhcp-config)#dns-server 192.168.2.3
Router(dhcp-config)#exit
```

4 DNS Configuration

4.1 DNS IP Address Configuration

4.2 DNS Services Configuration

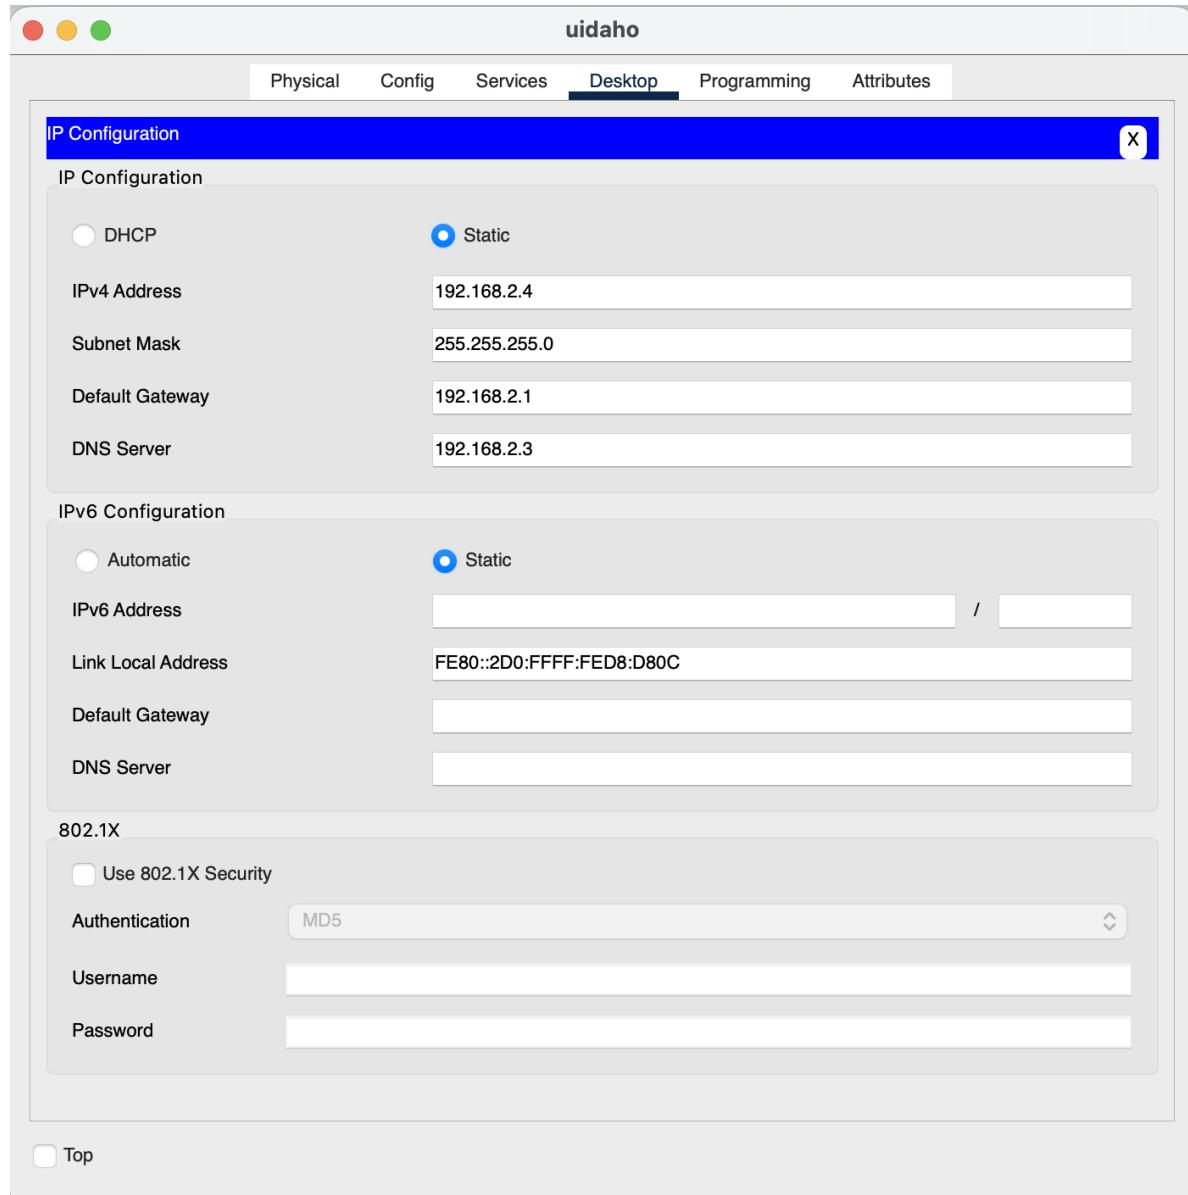

The screenshot shows the 'DNS Server' configuration interface. The top navigation bar includes tabs for Physical, Config, Services (which is selected), Desktop, Programming, and Attributes. On the left, a sidebar lists various services: HTTP, DHCP, DHCPv6, TFTP, DNS (selected), SYSLOG, AAA, NTP, EMAIL, FTP, IoT, VM Management, and Radius EAP. The main right panel is titled 'DNS' and contains sections for 'DNS Service' (status: On) and 'Resource Records'. Under 'Resource Records', there is a table with one entry:

No.	Name	Type	Detail
0	uidaho	A Record	192.168.2.4

Below the table is a 'DNS Cache' button. At the bottom left, there is a 'Top' button.

5 Web Server Setup

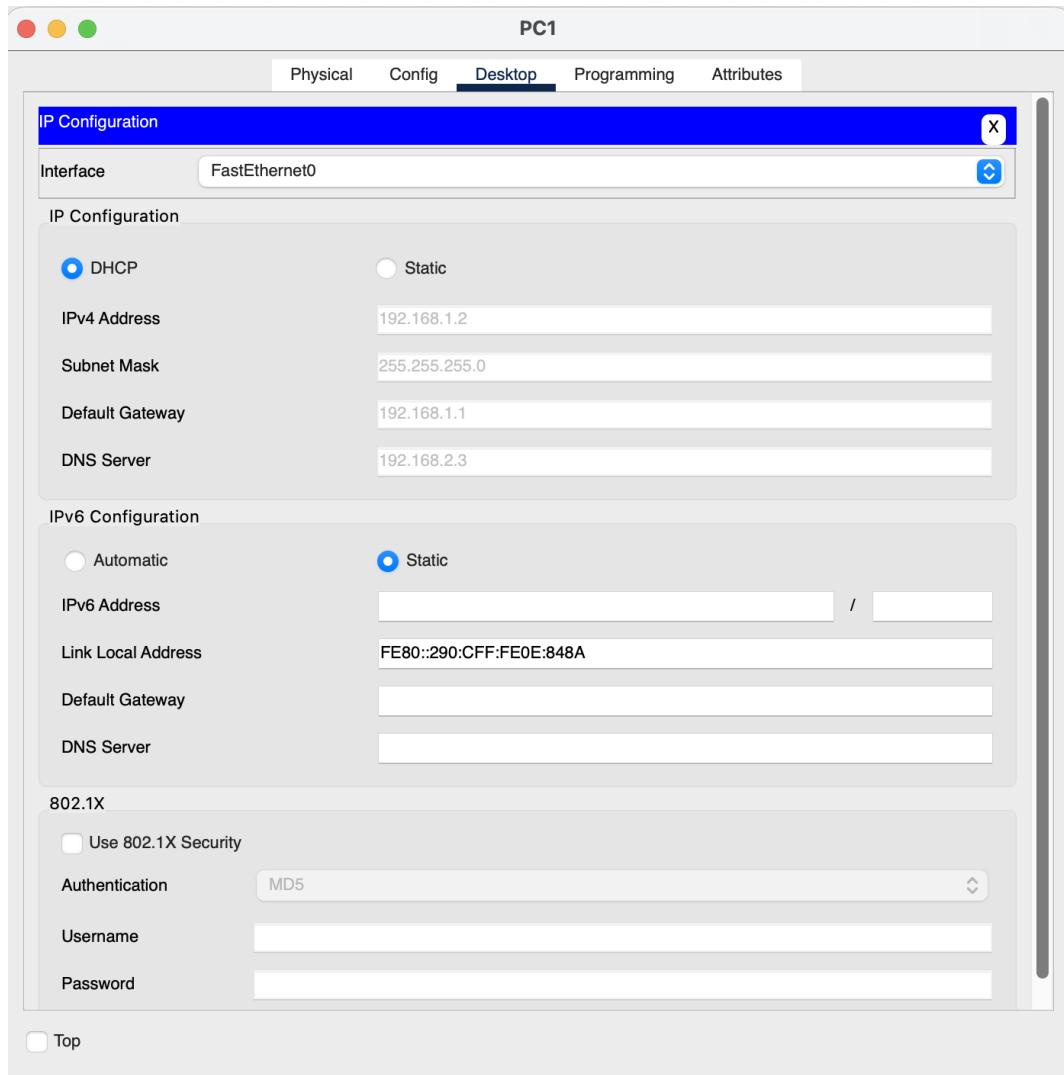

5.1 uidaho IP Address Configuration

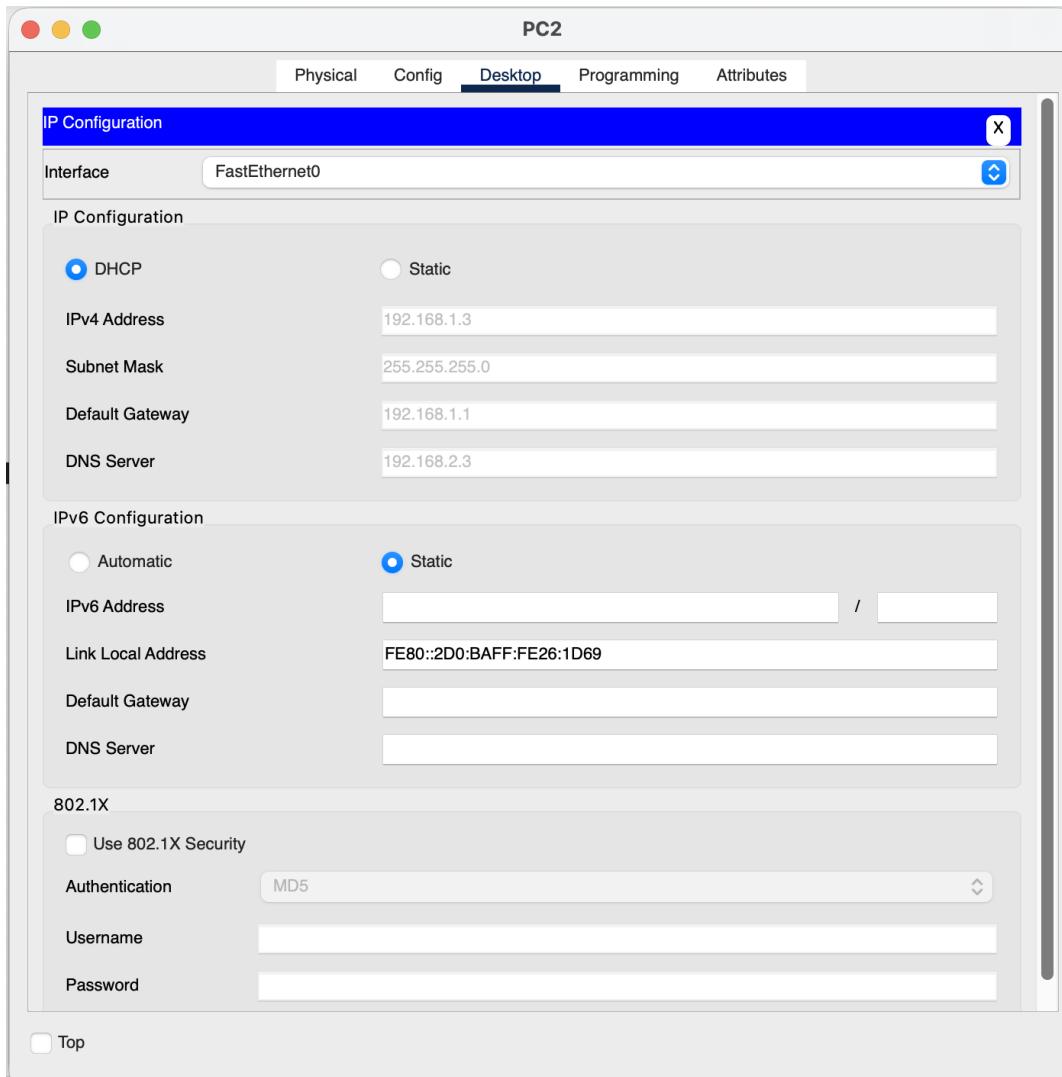

6 PCs IP Addresses Configurations

Done by the DHCP protocol (post DHCP configuration).

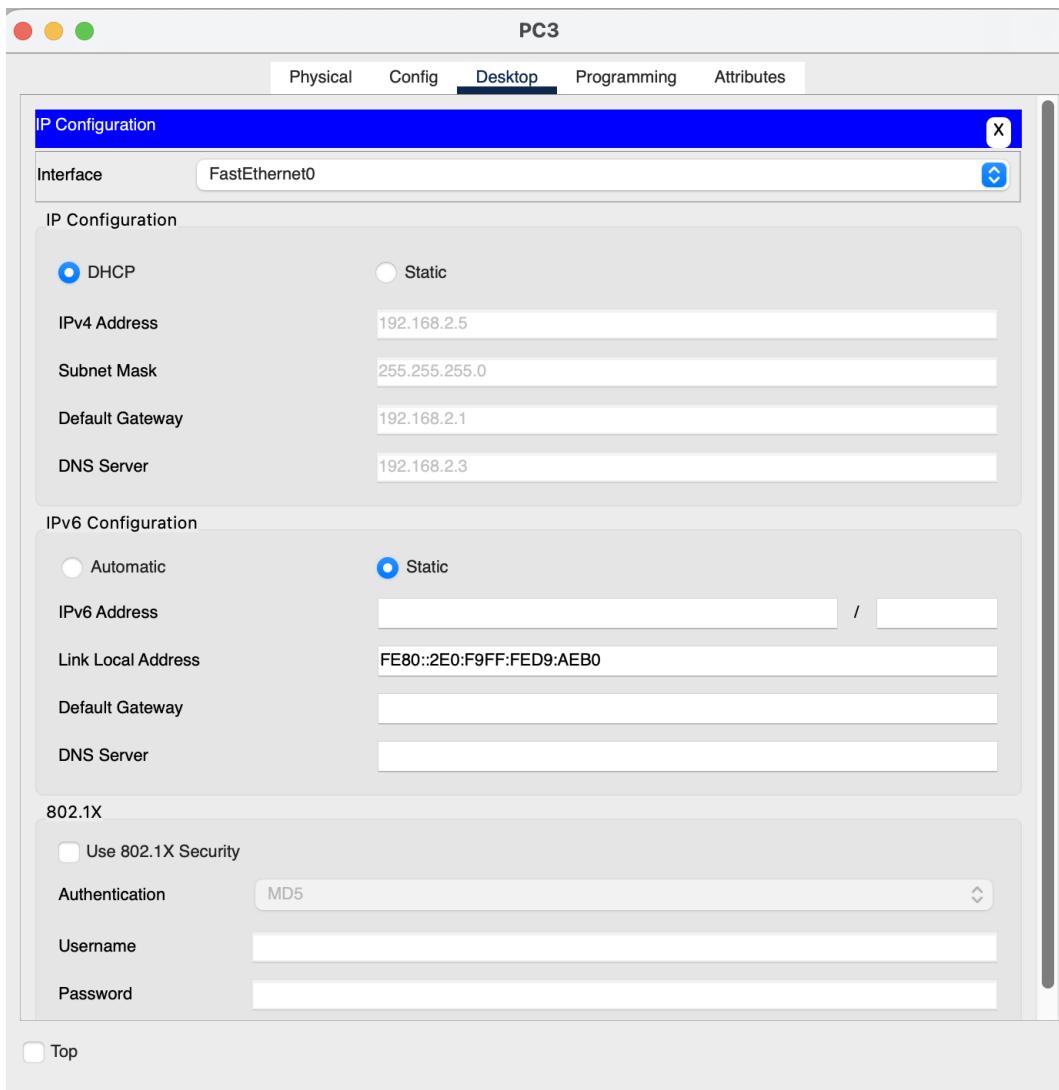

6.1 PC1

6.2 PC2

6.3 PC3

7 PCs Test Pings

Each PC has pinged the DNS Server, DHCP Server, Web Server, and other PCs on the network.

7.1 PC1

The screenshot shows the Cisco Packet Tracer interface for a device named "PC1". The window title is "Command Prompt". The menu bar includes "Physical", "Config", "Desktop" (which is selected), "Programming", and "Attributes". The main area of the window displays the following command-line session:

```
Cisco Packet Tracer PC Command Line 1.0
C:>ping 192.168.1.3

Pinging 192.168.1.3 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.1.3:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
C:>ping 192.168.1.3

Pinging 192.168.1.3 with 32 bytes of data:
Reply from 192.168.1.3: bytes=32 time<1ms TTL=128

8.2.6 PC TCP Response from the uidaho Server - Inbound

- Layer: 1
- Protocol: TCP
- Device: PC2
- Source: 192.168.2.4
- Destination: 192.168.1.3
- Destination Port: 1025
- Sequence Number: 0
- Acknowledgment Number: 1

8.2.7 PC TCP Response from the uidaho Server - Outbound

- Layer: 1
- Protocol: TCP
- Device: PC2
- Source: 192.168.1.3
- Destination: 192.168.2.4
- Destination Port: 80
- Sequence Number: 1
- Acknowledgment Number: 1

9 Conclusion

This project successfully demonstrated the design and simulation of a functional multi-subnet network incorporating DHCP, DNS, and web services. Through configuring the router, servers, and end devices, the network was able to dynamically assign IP addresses, resolve domain names, and establish client access to the web server. Comprehensive testing—such as inter-PC pings, DNS resolution, and the full TCP handshake—confirmed that communication between devices and services functioned as intended. Inspecting outbound and inbound PDUs further reinforced an understanding of how packets traverse the network stack and how each OSI layer contributes to reliable data delivery. Overall, the project strengthened practical networking skills and provided insight into how foundational network services interact within a real-world topology.
